QP07 metabolic kinase — quotation acceptance

Signed return copy

Brindlewythe Biosciences Ltd

Quorenthel Pharma GmbH

Quotation: BW01_0059

Date: 14/03/2001

1 Accepted scope and price

Brindlewythe Biosciences Ltd offers the Primary potency assay and Selectivity sweep for the Quorenthel aminopyrazine screening set QP07. The accepted package is intended to rank biochemical potency and describe a selectivity fingerprint. It does not establish cellular efficacy or a binding mechanism.

Signed quotation schedule

Item	Agreed scope
Study	BW01_0059
Client	Quorenthel Pharma GmbH
Screening set	24 QP07 compounds
Primary assay	Metabolic-signal kinase concentration response
Follow-up	Selectivity sweep on agreed representatives
Price	GBP 10,700
Turnaround from assay-ready start	42 days

This signed copy confirms the offered work and its acceptance terms. Results are not included: the quotation predates laboratory testing. Compound ranking will be released only after plate acceptance. Prepared by Dr B. Rowcroft, Screening Operations Director, 14/03/2001.

2 Material and shipment requirements

Quorenthel will supply labelled QP07 stocks with an identifier list, nominal concentration, solvent, usable volume and storage conditions. The package assumes a reconciled test lot suitable for a concentration response and the follow-up sweep. Client-supplied identity and stock concentration are used as declared; independent structure confirmation is not part of the offer.

At receipt, containers and list will be reconciled before laboratory use. A damaged container, unclear identifier or insufficient stock is held for clarification. The accession reference B-ACC-2001-01010 links the sample cards and run sheets. A replacement preparation will carry its own receipt note so that it is not confused with the original stock.

- Seal containers and package against leakage.
- State any precipitation or thawing restrictions.
- Provide safety and transport information.
- Agree changes to the screening set before dispatch.

The working clock begins when written acceptance and assay-ready material are available. A courier delivery alone does not release a test lot with unresolved identity or concentration. Remaining material will be retained for an agreed return or disposal instruction.

3 Primary potency assay and acceptance

The Primary potency assay uses recombinant metabolic-signal kinase with ATP at the working Km. Compounds are tested as a 10-point, threefold dilution from 10 μ M, in duplicate. Vehicle and staurosporine reference wells accompany each plate. The run sheet records enzyme preparation, ATP conditions, stock dilution and incubation timing.

Plate acceptance is assessed from control separation, the reference concentration response and replicate performance before compound fitting. A plate that fails the agreed method range will be rejected and repeated. Martin Ellerscombe will coordinate the assay record; Ines Alvarado will check the acceptance disposition.

Accepted curves will be fitted by a four-parameter logistic model and reported as IC50 in nM with a slope and any relevant qualifier. A partial curve is not forced into a precise finite IC50. An unusual curve shape or optical interference is flagged for discussion rather than described as a new inhibitory mechanism.

- Preserve rejected run sheets with the repeat reason.
- Exclude non-evaluable points only with a recorded reason.
- Keep biochemical ranking separate from cellular claims.

4 Selectivity sweep and deliverables

The Selectivity sweep will examine six agreed representatives against a 16-kinase off-target panel at 1 μ M. The representatives are chosen with Quorenthel after the primary rank is available. Selection is a screen gate; it is not permission to change the quoted compound count or add unrelated assays.

Every panel readout requires its own control acceptance. Percent inhibition is relative to the matched vehicle response at the stated concentration. A flag above 50% identifies a possible concentration-response follow-up; it is not an off-target IC50. No unquoted off-target concentration response is included.

The package delivers a signed report, the primary compound table and the selectivity matrix. The report begins with control disposition and the principal results table before discussing ranking. Anika Veldershain can support study reporting; Bethany Rowcroft is the point of contact for scope and client decisions.

The report will describe the compactness of a fingerprint without claiming a binding mode. Raw records, sample cards and amended reports remain connected to the accession reference. Queries about mapping or transcription are resolved against those records. Additional experiments require a separate instruction.

5 Commercial terms and signed acceptance

The agreed package price is GBP 10,700. Routine preparation, reference controls, ordinary technical repeats, reduction and the stated report are included. Additional compounds, new test lots and extra concentration responses require written scope and price agreement. Applicable taxes and transport are addressed in purchase documentation.

The planning basis is 42 days from the assay-ready start. Working dates will be confirmed after receipt reconciliation. A material limitation or unresolved technical exception will be communicated promptly; it will not be concealed to preserve a provisional release date.

Compound identities and data are confidential to Quorenthel Pharma GmbH. Remaining material is returned or disposed of only under the agreed instruction. Cancellation after commencement is reconciled against work completed and committed; no new charge is introduced without the corresponding commercial agreement.

Accepted for Quorenthel Pharma GmbH: the Primary potency assay and Selectivity sweep described in this quotation, at the stated GBP package price. Client approval is recorded on the returned signature copy. The signature ink is faint; the acceptance statement and quotation reference remain legible.

For Brindlewythe Biosciences Ltd: Dr B. Rowcroft. Signed 14/03/2001. Return copy received and filed with the quotation. This acceptance authorises the scope; it does not certify an experimental result.
